First day

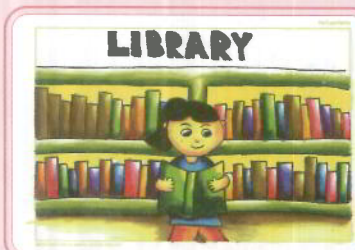

Global warming is the most serious problem in the world that concerns the whole society. The pollution in the air we breathe is stronger every day.

To prevent global warming pollution we should avoid making less use of electrical systems, recycling and not polluting the water. Global warming is changing our planet in some different ways.

First of all, climate

Indonesia

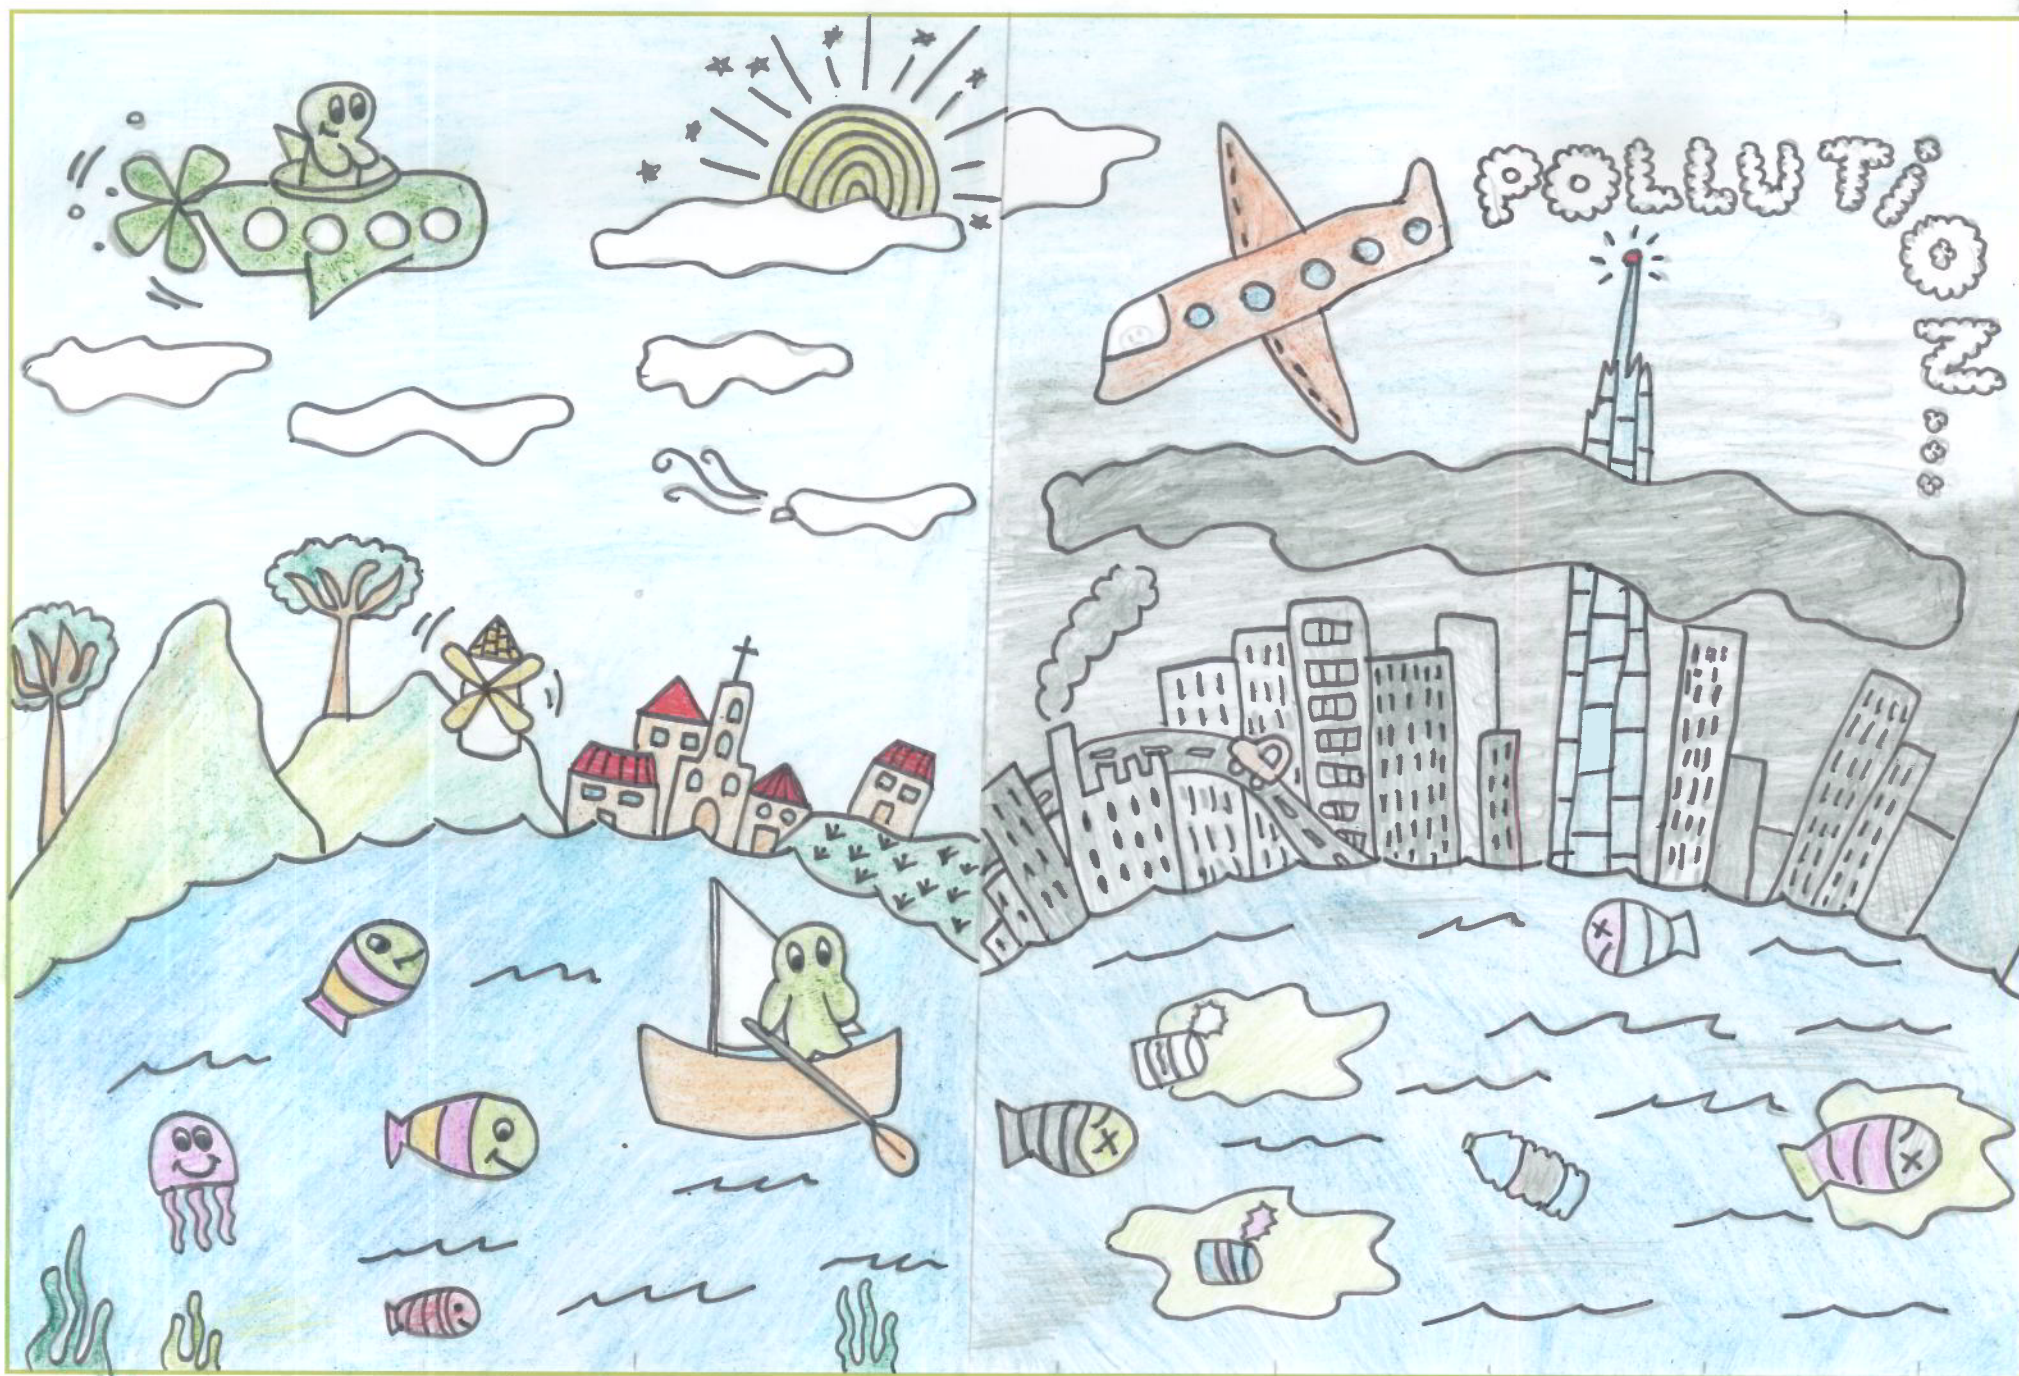

Our town is always hit by floods. Floods are always happening because a lot of rain falls and carries mountains of garbage along with it. I think we have to prevent flooding at all costs. The ground should be able to absorb water. I went to the library to look up how we could prevent flooding. When I did, I found a book called "Seepage Pits that Use Subterranean Creatures and Wet Garbage." This book interested me very much. The reason why is because it made me think that if we use the methods shown in the book, maybe we could prevent flooding easily, whether by ourselves or together with our friends or family.

Eco Activity Special Award 2011

Ukraine

The harmful emissions to the atmosphere caused by cars, trains, different factories and plants strongly influence on the ecology. People should go over to the use of electric cars and trolleybuses, that don't pollute the air. There are a lot of small old regular minibuses in our city. They should be replaced by the bigger modern buses, which can carry more passengers at one time. More cycleways should be arranged, so the people will be able to go by bicycles (which don't pollute the environment) to the office instead of cars.

Second day

Climate change is due to two main reasons:

- 1 The burning of fossil fuel like coal, oil and gas produces energy. This pollutes the air with extra CO_2 (Green house gas)
- 2 The other problem is when forests are cut down ^{without} replanting. The forest "eats" CO_2

If there are not trees, there are more CO_2 in the atmosphere

The more greenhouse gases we put in the atmosphere the warmer the temperature will get on Earth: this is what we call the Greenhouse effect.

 Peru

In my building we have organized ourselves in order to take care of our environment as follows: We have prepared cardboard dustbins, into which each person should throw away what they have already used, guided by the printed drawings such as bottles, cans and plastics. Also we have a cylinder that is useful for us in order to throw away the other trash. This should be done with the proper bag. These dustbins are in the centre and the corner of the park that is in front of my house. The boys and girls must water the plants and remove the weeds from them so that they grow up, and above all from the trees that are the lungs of our lives. Our pets help out by taking what they find and placing it in the right dustbins. Thus we keep our environment healthy.

 Chile

Some time ago, with my parents, I went for a walk around a lake, because our pet had got lost there. When we saw the lake, there was something that surprised us. There were a lot of hooks scattered all over the lake. My family and I felt so sad that we decided to do our best to collect all of the hooks and remove the poor dead fish.

REFLECTION: I believe that all the people who go fishing should be more concerned about what they're doing. They should always collect everything that they don't use and take it home, because, after all, they are the ones who eat the fish, and at the same time they are hurting nature. I ask only this: Think it over!!

Third day

Global warming is changing our planet in some different ways.

First of all, Climate change is also affecting our bio-diversity. In fact, some animals such as polar bears are in serious danger of going extinct. But can we really stop Global Warming? The answer is positive. We can reduce the amount of carbon dioxide in the atmosphere recycling glass, paper and cans and take a shower instead of a bath.

Japan

Recently, I talked with my father about the environmental protection activities I'm doing. He then told me about LED lights. He said that LED lights are better than other lights because they last long and save power. Afterwards, we went to a hardware store and bought an LED light to replace the light bulb that we use for the dinner table. My father told me that Tokyo Sky Tree, which is still under construction, will have as many as 2,000 LED lights.

Panama

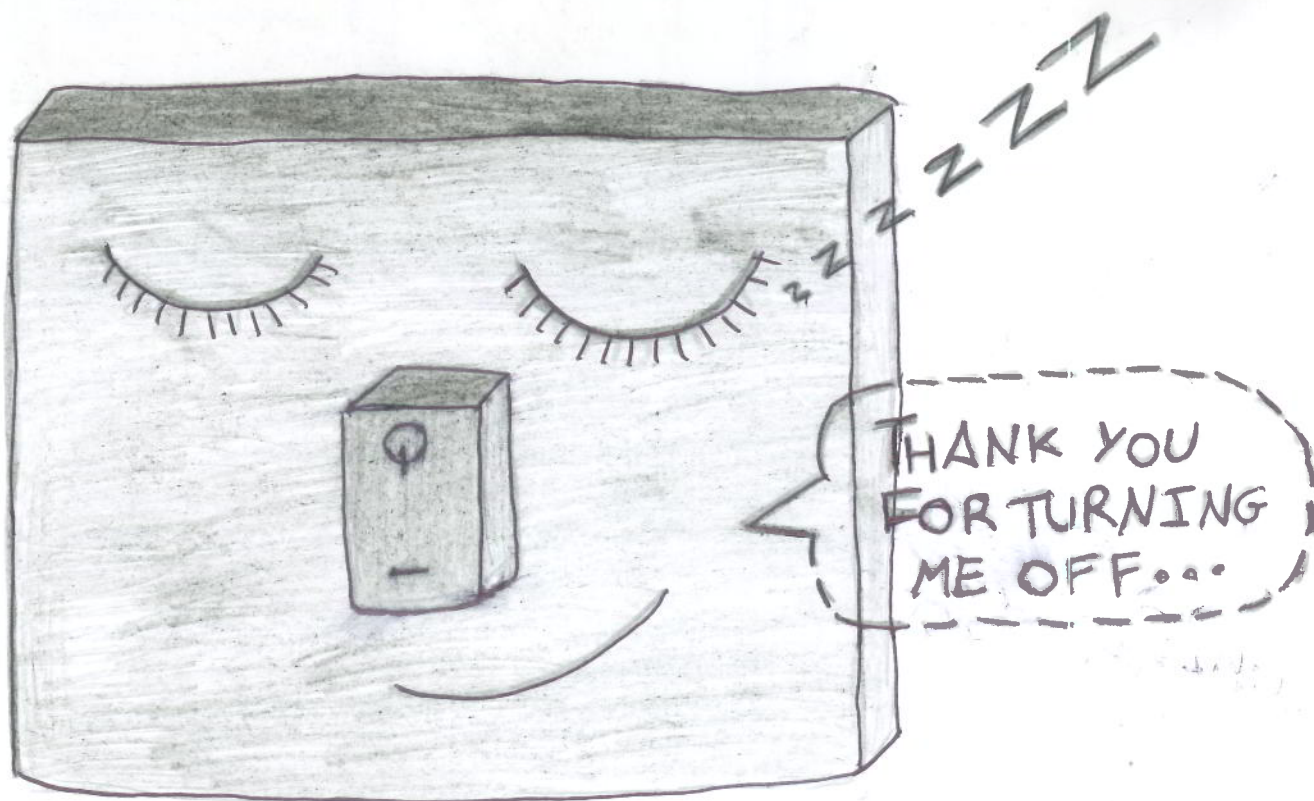

When I went out for a run, I realized that garbage was scattered everywhere, and I saw an unusual situation that happened because the garbage that people had thrown away was clogging up the drains, and the water couldn't flow through, and it became stagnant. When I gathered up the garbage I realized that it could be recycled in the garbage cans for designated materials.

Brazil

Whenever I go to the beach, I take a bag in order to throw away the trash such as soft drink cans and ice cream sticks. This prevents the trash from being carried out to the sea, killing sea animals and polluting the beach. We do the same thing in our car: we do not throw anything out the window. The most important thing is that we do not feel ashamed of setting a bad example. When we see anybody throwing trash out in the streets, we should ask the person politely not to make that mistake again.

Fourth day

How can we save energy in the classroom?

Wasting energy affects global warming in a negative way. If we all fight together against pollution, it will produce the best results.

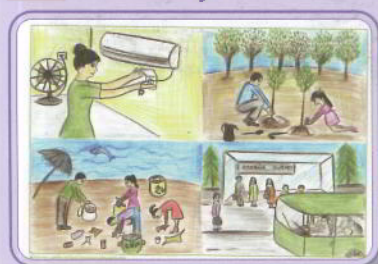

There are some different things you can do to save energy money. For instance, you can turn off the lights if you don't need them. If it is hot, we can also open the windows instead of air conditioning. Leaving electronic devices plugged in wastes energy, so we can also unplug them.

Fifth day

Conclusion :

If we all work together, a better world is possible.

Let's try to share with our friends, family and classmates what we have learned doing this project.

Let's preserve the planet for our future generations.
