ERV Ventilation

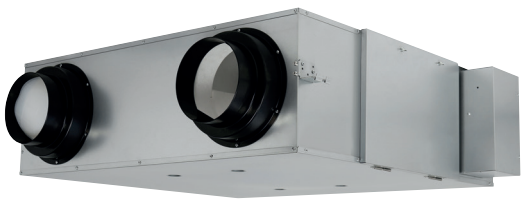
heating & cooling solutions

Energy recovery ventilation

Indoor air quality (IAQ) is a key consideration for anyone looking to create a healthy and comfortable environment. An energy recovery ventilator (ERV) provides balanced, energy-efficient ventilation by transferring heat and moisture between incoming filtered fresh air and outgoing stale air. In the winter, an ERV keeps heat and moisture inside the building. During hot, humid summer months, it maintains cool, dry indoor air.

New advanced ERV ZY Series.

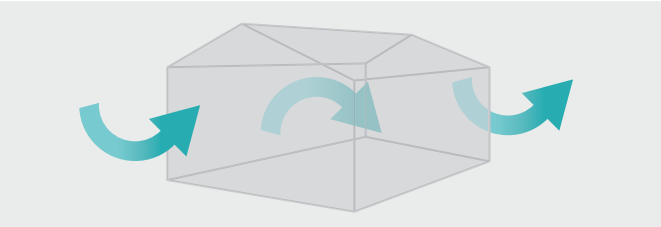
- 5 model line-up including 1000 m³/h model
- DC motors
- ESP up to 150 Pa
- F7 grade filter built-in as a standard
- New intuitive remote controller
- BMS integration with RS485



Home Airtightness

Homes designed and built in recent years are more airtight and energy efficient than in the past. To obtain an airtight design, house wraps, newly designed windows and doors, sealing caulks and other insulating materials are used to create a seal for optimum energy efficiency.

It results in cost savings to both heating and air conditioning at home. Pollutants retained in airtight buildings can be hazardous to our health and can jeopardize structural integrity.

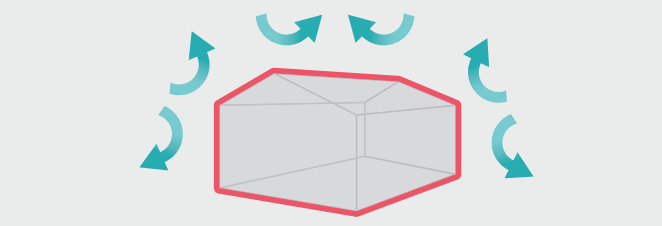


Houses Built in the Past

Natural and wooden building material were adopted that allow air exchange between interior and exterior

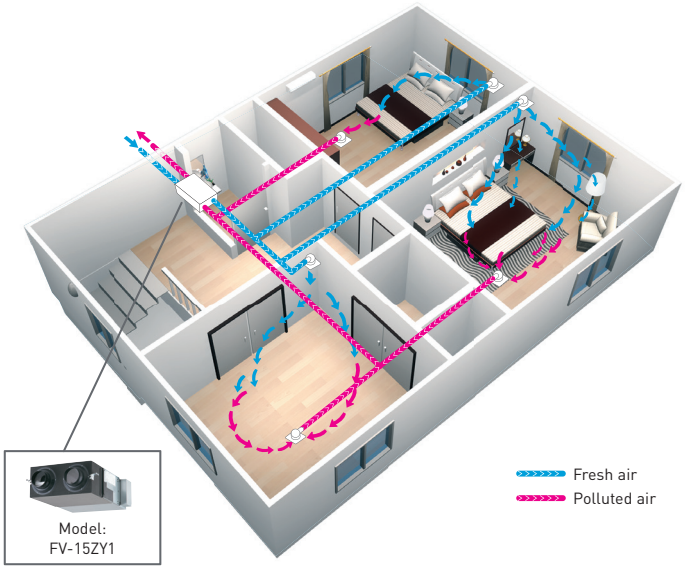
Highly efficient filter for better air supply

Chemical made building material and sashes are employed to ensure high airtightness automatically.

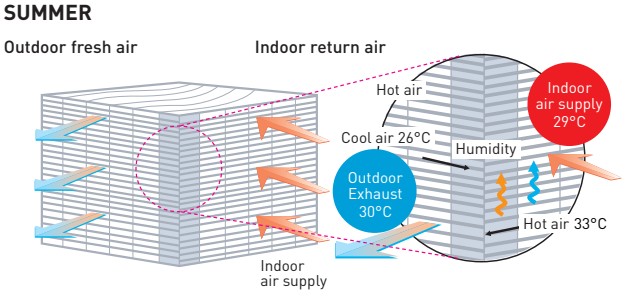


Enjoy Double Comfort with Interlocking Air Conditioning

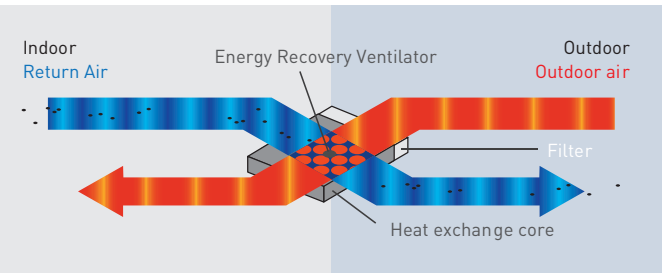
The newly developed energy recovery ventilator can interlock air conditioning. It allows you to enjoy both fresh air and a comfortable temperature.



Inside of Heat Exchange Core (diagram)

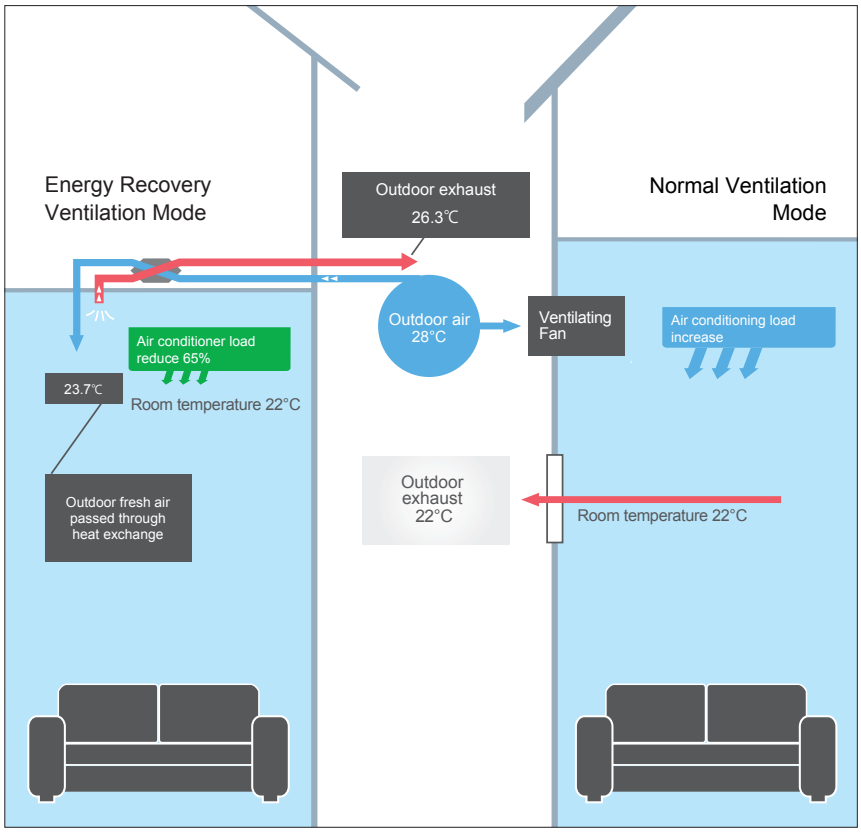


Principle of Heat Exchange



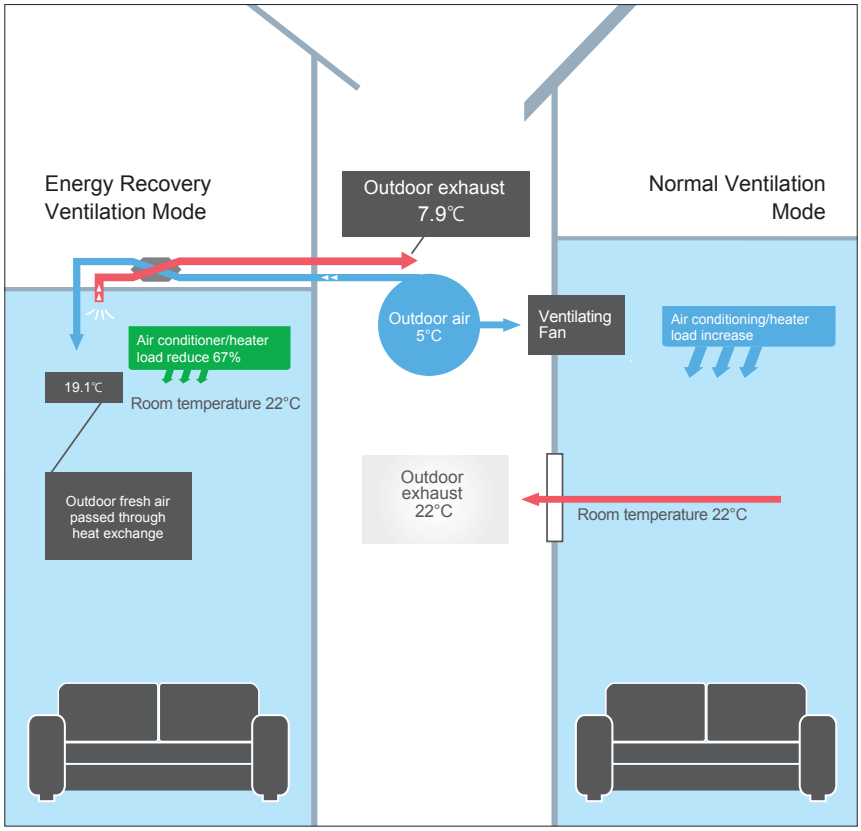
Merit of Energy Recovery Ventilation

Highly efficient energy recovery reduces energy loss during ventilation, thus achieves energy saving (Example: FY-35ZY1)



Summer

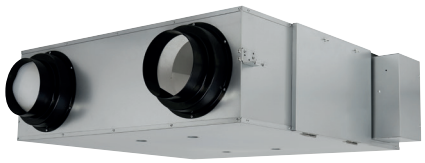
Utilise cold stale indoor air to cool down incoming warm fresh outdoor air via the heat exchanger.



Winter

Utilise warm stale indoor air to temper incoming cold fresh outdoor air via the heat exchanger.

New advanced energy recovery ventilation ZY Series

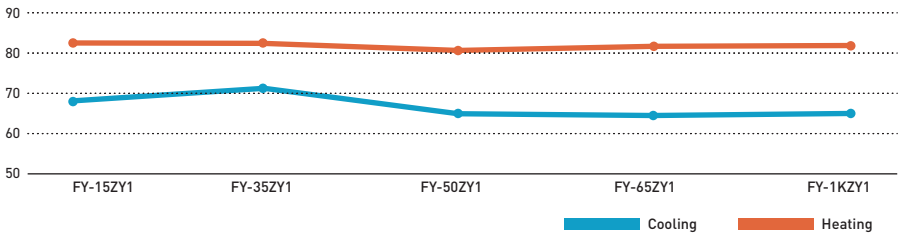


Recovers up to 83% of the heat in the outgoing air

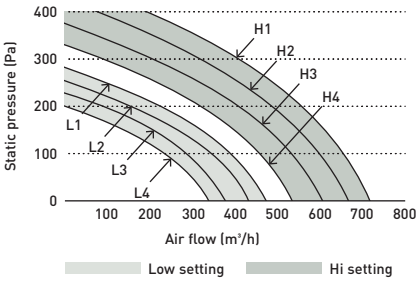
ZY Series achieves more than 80% of heat exchange efficiency in all the line-up [1]. The high recovery rate optimizes operation cost and can be considered as a sustainable solution.

1) Heating operation, H1 speed setting.

Heat exchange efficiency (%).



Ventilation volume setting PQ curve example.

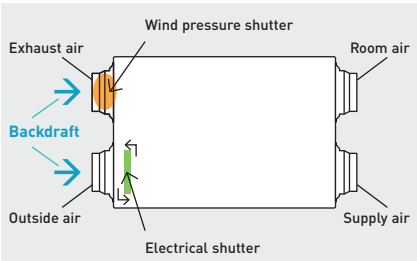


Easily adjustable for air volume balance

DC motors are equipped with independent control settings for air supply and exhaust. Air volume balance can be easily adjusted with 4 speeds settings for each Hi / Low operation.

Highly efficient filter for better air supply

An effective **EN F7 grade filter** is built-in as a standard.
The F7 filter captures 99.97% of 0.3 micro particles and is capable of filtering pollen, fine dust, dust mites and bacteria.
Expected cleaning maintenance cycle is once per month, with an average of 4-6 months for replacement in high demand environments.



Backdraft shutters equipped as standard

A backdraft shutter prevents air flowing in the wrong direction when the ERV system is not in operation.
The shutter at OA (outside air intake) side is inter-locked with ON / OFF switch.
The shutter at EA (exhaust air outlet) side opens with the pressure generated by air stream then closes automatically.

New intuitive remote controller with RS485 MODBUS connection

- Simple and clean screen with white back light panel
- RS485 terminal equipped to integrate with Building Management Systems
- Metal switch box is included in the package

Notes

Do not add or replace refrigerant other than the specified type. Manufacturer is not responsible for the damage and deterioration in safety due to usage of the other refrigerant.
The outdoor units in this catalogue contains fluorinated greenhouse gases with a GWP higher than 150.
